Euler did not discover e or π , but he gave both of them their names. In contrast, Euler discovered, but did not name γ , the third and least known of these constants. This γ is usually known as the Euler-Mascheroni constant, acknowledging both the work Euler did in discovering the constant in about 1734, (more on this later) and the work of Lorenzo Mascheroni (1750-1800).

How Euler Did It by C. Edward Sandifer - Goodreads

Euler's contribution. As Ed Sandifer states in his paper How Euler did it, "Knight's Tours are closely related to a kind of magic square called 'pandiagonal', and Euler wrote about pandiagonal magic squares in 1779, when he wrote 'Recherches sur un nouvelle espèce de quarrés magiques' (Researches on a new kind of magic squares)".

Euler and the Knight's Tour | ChessBase

The Euler triangle of a triangle is the triangle whose vertices are the midpoints of the segments joining the orthocenter with the respective vertices. The vertices of the triangle are known as the Euler points, and lie on the nine-point circle.

Evil-Euler Triangles And Did Kristen Kill LeRoux And Is ...

His letters to Euler show an early respect, addressing him as “highly educated and brilliant” when Euler was only 21. The salutations in following letters rapidly escalated to frank awe; in 1745 Bernoulli, known as definitely not given to flattery, addressed his letter to the 38-year-old Euler: “To the incomparable Leonhard Euler, the prince among the mathematicians”. 25
