THEORY AND COMPUTATION OF HYDRODYNAMIC STABILITY

Classical hydrodynamic theory shows that flow about a body can be generated by using the appropriate distributions of sources, sinks, vortices, and dipoles distributed both within and about itself. Increased computational power has led to the development of panel methods, and these have now become commonplace for the solution of potential flow problems about arbitrary bodies.

Ocean (hydrodynamic) waves are produced as a result of an infusion of energy, either as a result of atmospheric winds or significant water body displacement from seismic events (earthquake, landslide, etc.).A wave is a series of rolling bodies of water moving in the direction of their roll. Their energy is transmitted down through the water depth in elliptical orbits the eccentricity of which ...
